

(Solutions)

Q. (1) Ans.  $\Rightarrow$  (B)

Q. (2) Ans.  $\Rightarrow$  (C)

Q. (3) Ans.  $\Rightarrow$  (D)

(B)  $\text{SF}_6 + \text{H}_2\text{O} \longrightarrow \text{X}$  (Not hydrolysed at room temp. becoz transition state do not exist due to steric crowding)

hydrolysis is not possible becoz N(+8) does not have vacant orbital.

Q. (4) Ans.  $\Rightarrow$  (A)

Q. (5) Ans.  $\Rightarrow$  (C)

Q. (6) Ans.  $\Rightarrow$  (B)

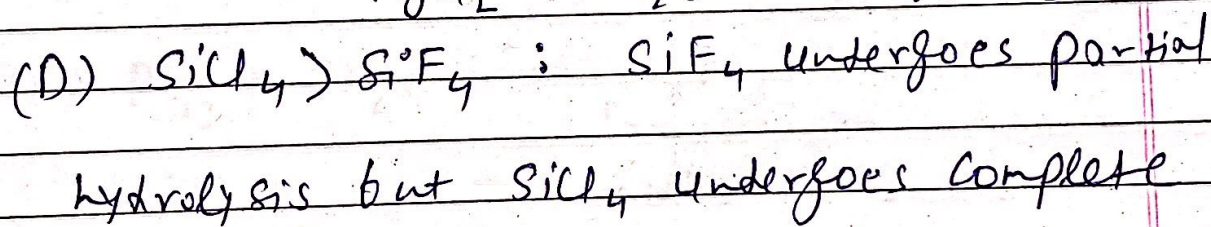

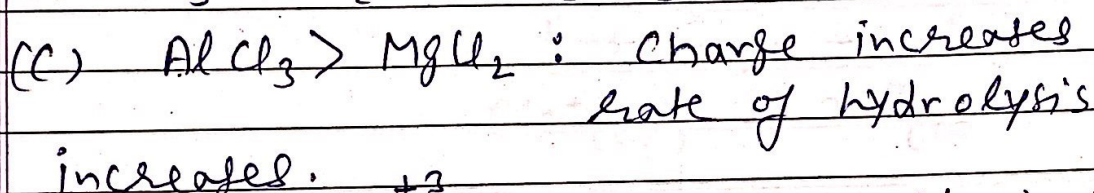

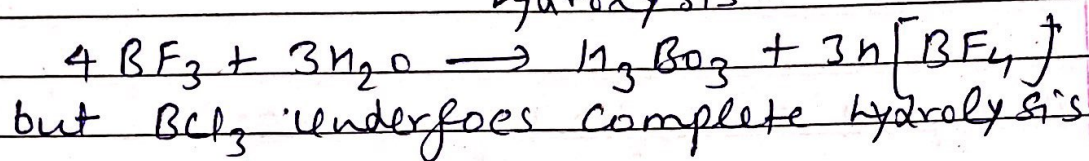

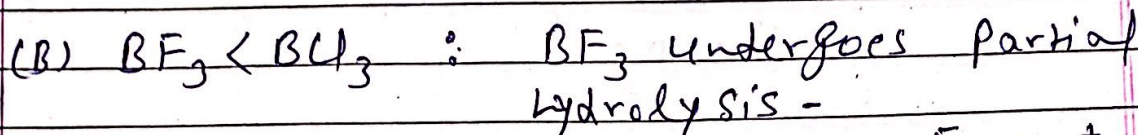

'F' is bad

leaving

group due

to additional  $\pi$ -bond character due back bonding.

Q. (7) Ans.  $\Rightarrow$  (A, B)

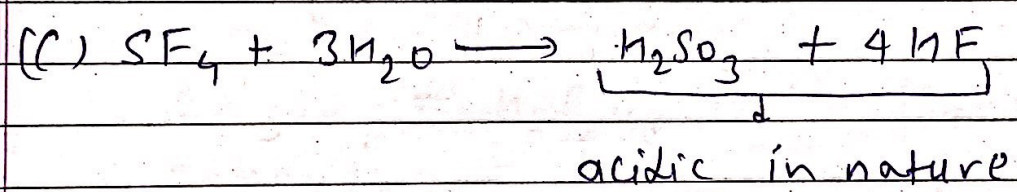

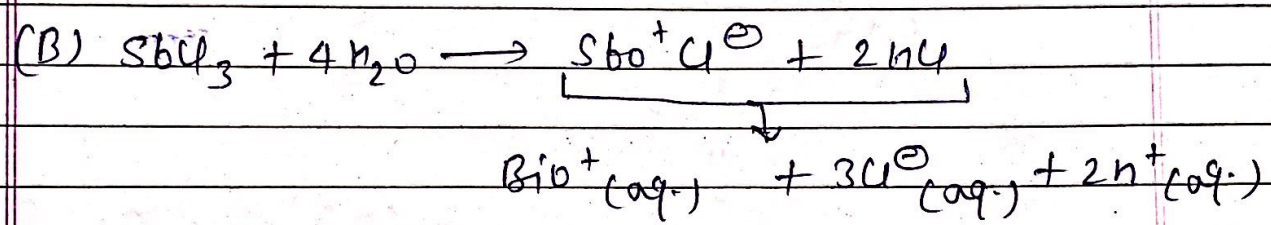

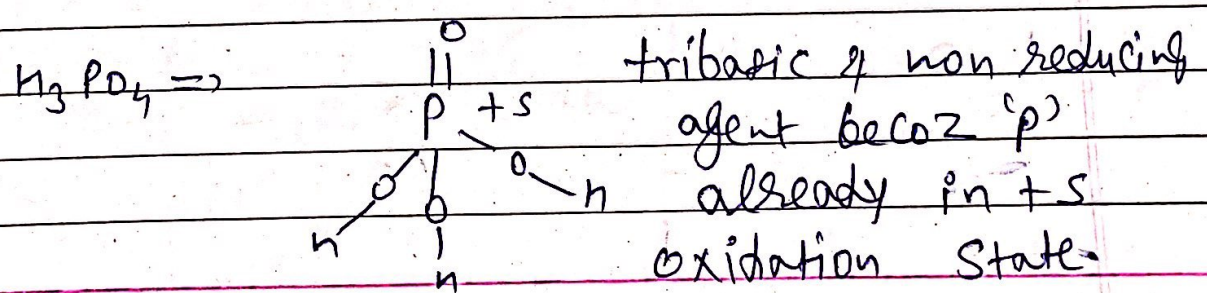

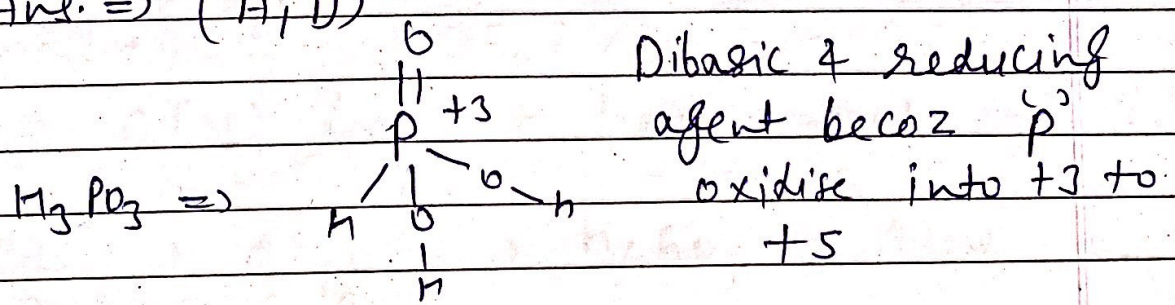

Ans.  $\Rightarrow$

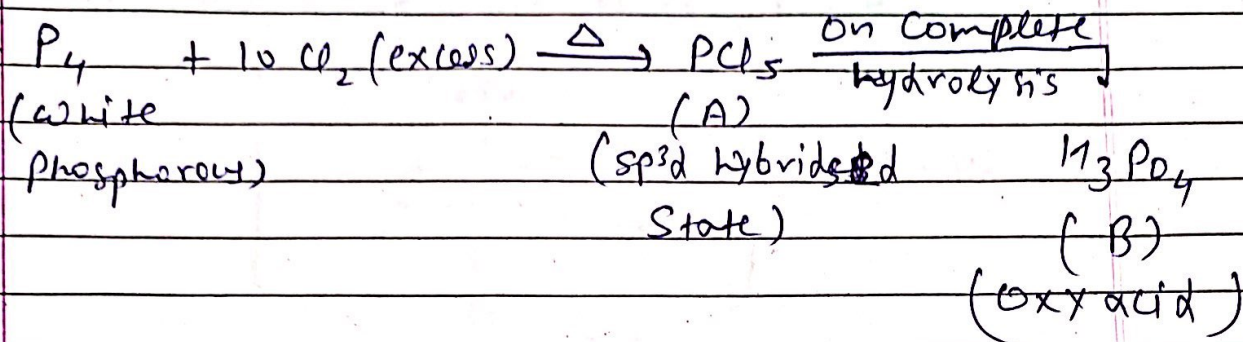

Q.8 (C, D)

Q.9 Ans.  $\Rightarrow$  (A, D)

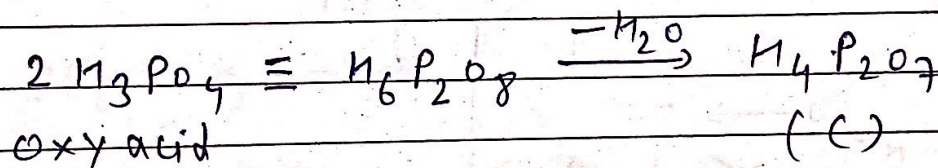

Q. (10) Ans.  $\Rightarrow$  (D) Anhydride of  $H_3PO_4$  is

Q. (11) Ans.  $\Rightarrow$  (B)

Q. (12) Ans.  $\Rightarrow$  (3) :  $SiCl_4, PCl_3, AsCl_3$

(i)  $CCl_4 + H_2O \longrightarrow X$  (does not hydrolysed becoz C(+4) does not have vacant orbital)

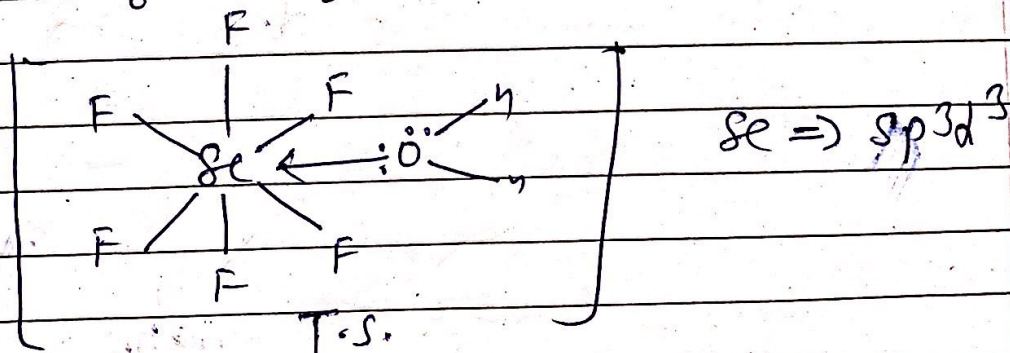

T.S.

$Si \Rightarrow sp^3d$

T.S. do not exist due to steric crowding

T.S. exist due to Se has large size.
